

Biofeed's prebiotics are under further research to determine if they can compete economically with the use of limes, ammonia, and caustics in the treatment of acid mine drainage. NUTREX™ and AERO™ show a nice buffering capacity with additional pH adjustment due to the breakdown of amino acids into ammonia. After reviewing the results from this study's treatment of AMD, Biofeed's formulators are working on new products that may be more beneficial to the mining industry.
